

Observations from the 2003 North American Migration Count

Bill Etter

Overview

May 10, 2003 marked Pennsylvania's twelfth year of involvement in the North American Migration Count (NAMC), and for the twelfth straight year, participation continued to grow. Despite lousy weather across much of the state, 1,035 birders got out in the field and counted! This total exceeds our previous record of 1,017, which was set in 2002 under near-perfect weather conditions. Data was received this year from 61 of Pennsylvania's 67 counties, and 239 species were recorded across the state. Participants racked up 3,456 field hours, and counted 288,196 birds. Exactly! Not too shabby! Many thanks to all of the perseverant souls who helped out with this year's count! Without such dedicated observers, NAMC data would be useless.

Weather

Weather on May 10th wasn't terribly pleasant, but the frontal system that passed across the lower portions of the state may have grounded many migrants, resulting in better birding in areas where observers could actually get out to count. The front produced storms across the southwestern and south central portions of the state, especially early in the day. Weather seemed to vary in intensity from county to county, but resulted in poor conditions across the region. In *Westmoreland*, Dick Byers reported "heavy rains, floods that blocked roads, dangerous cloud-ground lightning storms and downed trees that made some trails impassable. Worst weather in our count history." In *Bedford*, Ross and Peter Gallardy experienced weird weather, characterized by off and on thunderstorms, and over three hours' rain delay. They made the most of a bad situation, as Ross reported: "In the rain we saw Horned Grebe, Common Loon, Lesser Scaup, Ring-billed Gull, and five species of swallow. We then sat for two hours waiting for the thunderstorm to stop. A few times we thought it was done lightning, so we

got out to bird in the rain. Soon after...lightning would strike very close. We went back to the car. It was around 9:40." The afternoon high was only 60°F in *Bedford*. One county to the east, in *Fulton*, Regina Reeder reported "a very productive day considering the thunder storms that greeted us first thing this morning". Moving further east, Barry Blust reported similarly from *Chester*: "I counted at Marsh Creek and its periphery roads for the NAMC today. Despite the showers early this morning the day proved to be very enjoyable and productive."

Elsewhere in the southeast, *Bucks* experienced little more than 100% cloud cover throughout the a.m., with partial clearing in the afternoon. No rain. No wind. In north central, *Lycoming* reported similar conditions, but sixteen degrees warmer (afternoon high of 78° F). In the northwest, *Erie* reported light rain in the morning, clear skies by the afternoon, and full cloud cover again by dusk.

Participation

The goal for the 2003 count was simply to surpass the record totals set in 2002. The fact that this goal was met is a testimony to the dedication of many birders who participated, even in parts of the state where the weather might have been a discouraging factor. Overall, we added eighteen participants and two counties. Counties lost this year were *Jefferson* (12 hours last year), *Lackawanna* (2 hours), and *Snyder* (11 hours). Counties gained were *Columbia* (12 hours), *Somerset* (8 hours), *Sullivan* (12 hours), *Union* (4 hours), and *Warren* (38 hours). Once again, no reports were received from *Cameron*, *Clinton*, or *Monroe*, in addition to the three lost counties mentioned above.

While *Bucks* had the most total participants, it fell short of *Indiana* and *Franklin* for most total hours. Ten counties contributed 100+ hour efforts this year.

Table 1. Counties with the most participants.

1	Bucks	79
2	Franklin	72
	Indiana	72
4	Schuylkill	54
5	Lancaster	43
6	Allegheny	39
7	Berks	38
	Greene	38
9	Bedford	34
10	Dauphin	33

Table 2. Counties with the most hours (compared to ranking of number of participants).

1	Indiana	227 (2*)
2	Franklin	224 (2*)
3	Bucks	191 (1)
4	Schuylkill	180 (4)
5	Bedford	166 (9)
6	Berks	158 (7*)
7	Lancaster	155 (5)
8	Westmoreland	106 (11)
9	Dauphin	105 (10)
10	Greene	104 (7*)

(* = Tie)

Seventeen counties had twenty or more participants. Of these, *Bedford* put forth the greatest collective effort, with an average of nearly five hours per observer.

Table 3. Greatest effort, by hours per observer. Calculated for counties with 20 or more participants (number of participants noted).

1	Bedford	4.87 (34)
2	Berks	4.14 (38)
3	Luzerne	3.86 (22)
4	Lancaster	3.60 (43)
5	Clearfield	3.54 (20)
6	Schuylkill	3.33 (54)
7	Westmoreland	3.30 (32)
8	Dauphin	3.17 (33)
9	Indiana	3.15 (72)
10	Franklin	3.11 (72)

Many people went above and beyond the call of duty this year, but some efforts were particularly noteworthy. Tom Johnson and Deuane Hoffman birded *Northumberland* for 15 hours, and counted nearly 4,000 birds of 138 species. The most impressive effort, however, probably came from Ross Gallardy, who did a big day with his father, Peter Gallardy. Their day began at midnight and lasted over 21 hours. Ross kept totals the entire time and submitted reports for no fewer than four counties (*Bedford, Cambria, Fayette* and *Somerset*)! They recorded 132 species for the day, despite over three hours' rain delay!

Species encountered

This year's good flight yielded new High Counts (HC) for a total of 60 species, including 18 warbler species and the Lawrence's hybrid. Among the more significant new High Counts were Red-necked Grebe, Double-crested Cormorant, Great Blue Heron, Black Vulture, Common Merganser, Osprey, Northern Harrier, Coopers Hawk, Northern Goshawk, American Kestrel, Wild Turkey, Wilson's Snipe, American Woodcock, Laughing Gull, Bonaparte's Gull, Common Tern, Forster's Tern, Barred Owl, Northern Saw-whet Owl, Yellow-bellied Sapsucker, Common Raven, Swainson's and Wood Thrush, European Starling, Blue-winged, Yellow, Black-throated Blue, Black-throated Green, Blackburnian and Prairie Warblers, Ovenbird, Vesper and White-throated Sparrow, Brown-headed Cowbird, and House Sparrow.

Table 4. Most abundant species by total birds counted.

1	Laughing Gull	30,080
2	European Starling	14,190
3	American Robin	14,145
4	Red-winged Blackbird	12588
5	Common Grackle	11877
6	Canada Goose	11676
7	Tree Swallow	8543
8	Barn Swallow	7054
9	American Crow	7052
10	Gray Catbird	6880
11	House Sparrow	5823
12	American Goldfinch	5683
13	Blue Jay	5486
14	Mourning Dove	5316
15	Yellow-rumped Warbler	4934
16	Northern Cardinal	4835
17	Common Yellowthroat	4636

18	Song Sparrow	4599
19	Ovenbird	4436
20	Yellow Warbler	4332

Table 5. Most widespread species by number of counties in which they were found (compared to overall abundance ranking).

1	Mourning Dove	61 (14)
2	Ruby-throated Hummingbird	61 (74)
3	Blue Jay	61 (13)
4	American Crow	61 (9)
5	Barn Swallow	61 (8)
6	American Robin	61 (3)
7	Common Yellowthroat	61 (17)
8	Northern Cardinal	61 (16)
9	Chipping Sparrow	61 (21)
10	Song Sparrow	61 (18)
11	American Goldfinch	61 (12)
12	Downy Woodpecker	60 (54)
13	Northern Flicker	60 (46)
14	Tree Swallow	60 (7)
15	Gray Catbird	60 (10)
16	Common Grackle	60 (5)
17	Baltimore Oriole	60 (26)
18	Turkey Vulture	59 (33)
19	Canada Goose	59 (6)
20	Mallard	59 (28)

Count highlights

A closer look at some of the highlights and trends from Pennsylvania's 12th NAMC:

Loons through ducks

Pennsylvania's big birding story in early 2003 was the huge invasion of Red-necked Grebes, which very likely resulted from extensive freezing on the Great Lakes. Many of the hundreds to thousands of birds that visited our state lingered into May. Red-necked Grebes were reported on our NAMC for only the third time, with 16 birds seen in 7 counties (*Dauphin* 5, *Lancaster* 4, *Pike* 3, *Berks*, *Cumberland*, *Lebanon* and *Philadelphia* 1 each). The previous HC was two, recorded first in the invasion year of 1994, then again in '96. Double-crested Cormorant numbers continued to grow, with 2,138 recorded in 41 counties. This is just over *twice* the previous NAMC high of 1065 from the 2002 count. As the species' numbers continue to expand within the state, it will be interesting to see if new nesting is documented. Double-crested Cormorants were reported widely across the state, but the highest counts came from *Bucks*

(614), *Erie* (404) and *Lancaster* (327). Reports of Great Blue Herons continue to increase on the count from year to year, with a new HC of 867 this year. The highest counts were made in the southwest corner of the state, with 104 reported from both *Greene* and *Washington*. Other high counts occurred in *Bucks* (69), *Tioga* (54), and *Lancaster* (53). Little Blue Heron was missed for the second year straight, but a few other nice waders were found, including Snowy Egret in *Philadelphia*, and Least Bittern in *Philadelphia* and *Berks*. Yellow-crowned Night-Heron was another miss, but 128 Black-crowned were seen in six counties, nearly all found along the lower Susquehanna River (112 in *Lancaster* alone).

A new HC of Black Vultures was made this year. 260 were seen across 17 counties, with the highest counts in the southeast (130 in *Lancaster*), and *all* within the southern half of the state. 2,357 Turkey Vultures were just shy of last year's HC, and they were seen in nearly every county reporting.

Eighteen duck species (about average for the PA NAMC) were recorded, including new HCs for Gadwall (11), Lesser Scaup (50, thanks to 45 in *Erie*) and Common Merganser (214). Common Mergansers are increasing on the count annually, and are distributed widely throughout the state. The rise in numbers may reflect the expansion of the species' breeding range within the state. A particularly nice waterfowl report was received from *Butler*. Gene Wilhelm reported a dozen species of ducks on Lake Arthur at Moraine State Park. Gene's report included Gadwall, American Wigeon, Northern Shoveler and 44 Ruddy Ducks!

Raptors

New High Counts were established for five raptor species this year: Osprey (234), Northern Harrier (40), Cooper's Hawk (96), Northern Goshawk (5), and American Kestrel (283). Perhaps our least known breeding raptor, Northern Goshawk was recorded in four counties: *Huntingdon* (2), *Luzerne*, *Warren* and *Wyoming*. It is hoped that all are nesting birds. The *Huntingdon* birds were, in fact, nesters. Unfortunately, the attempt failed. The birds in *Luzerne* and *Warren* were seen near

previously known nest sites.

The most exciting raptor story may be that of our Osprey population. A record count of 234 Osprey was made this year as this threatened species continues to expand its numbers within Pennsylvania! Our previous HC was 160 birds in 1997; only 84 were counted last year. Osprey were widely distributed across 46 different counties, but the highest counts came from along the lower Delaware River, in *Northampton* (35) and *Bucks* (18). Other significant counts came from *Lancaster* (15), *Schuylkill* (14) and *Tioga* (13). The *Northampton* Osprey total was high for two reasons, not the least of which is the four active nests in the county. Additionally, compiler Mike Schall reported a strong push of migrants over Blue Mountain that afternoon. At least 17 migrants were counted, including 13 over Smith Gap in just one hour.

2003 was a milestone year for Peregrine Falcons in Pennsylvania! While the NAMC total (9) was not particularly high, the number of counties reporting (7) was a new record. The weather probably had a negative effect on Peregrine totals this year, as there were no reports from at least a few different known urban nest sites. Two reports were especially exciting, as they marked the first confirmed selections of natural cliff nesting sites by this endangered species since 1957! It's encouraging to see that reintroduction efforts have finally met with such success! Among the Peregrines counted on the 2003 PA NAMC were possible nesters at the Delaware Water Gap in *Northampton*, as well as confirmed nesters with one chick on a cliff overlooking the west branch of the Susquehanna River.

The Bald Eagle is another endangered species that is closely watched as it's numbers increase here in Pennsylvania. This year's count of 70 Bald Eagles was second only to the 2002 count. As last year, they were tallied in 26 counties. Adverse weather may have affected totals for this species.

Eagles were reported from many of the same locations as last year, but totals from several counties were significantly lower – most notably from *Lancaster*, where 27 were noted in 2002 compared to this year's 15. For the combined 2002 and 2003 NAMCs, Bald Eagles were tallied in 37 different

counties, but in only 26 on either given year. *Lancaster's* 15 Bald Eagles was by far the top count. Five birds each were reported from *Pike* and *Wayne*, and four each from *Butler* and *Tioga*. Only ten birds were reported from the northeast corner of the state, and just two from Pymatuning in *Crawford*. This, combined with the lessened counts on the lower Susquehanna seems to suggest (hopefully) that many Bald Eagles went unnoticed on this year's NAMC.

Table 6. Occurrence of Bald Eagle on the PA NAMC since 1997.

Year	Total	Counts
1997	28	12
1998	35	13
2000	31	13
2001	55	21
2002	98	26
2003	70	26

Game birds, rails, shorebirds

Ring-necked Pheasants hit an all-time NAMC low, with only 102 birds reported. While noted in 32 counties, the top count was only 12 birds, recorded in *Carbon*. Northern Bobwhites were even scarcer, with just 11 reported – about average for NAMC. The count for Wild Turkey, on the other hand, was a new NAMC high, with 761 tallied statewide. The highest counts, by far, came from *Greene* (93) and *Berks* (84).

Rails are always a challenge to locate. This year was no exception, although some above-average counts were made. Sora had the second highest count ever, with 38 birds in 17 counties. Twenty-four Virginia Rails wasn't bad either. Common Moorhens were on four counts. American Coots were another all-time low, with just two in *Franklin*, and a single bird in *Dauphin*.

Barb Dean counted two Sandhill Cranes in *Lawrence*, near an area where they have been known to nest recently. A flock of cranes has wintered there for the past two years. A pair of Sandhills was discovered in Susquehanna County just days before the count. While not actually seen during the NAMC, they were reported in subsequent weeks. Other known cranes within the state were either not looked for, or possibly just not found due to the fact that, like all birds, they

can be rather elusive creatures.

Shorebird numbers were generally below average due to the wet spring and resulting lack of appropriate habitat. A few interesting species turned up this year, however, including the count's first Whimbrel and first Red-necked Phalarope! The Whimbrel was found in *Wayne*, at Keen's Pond in Waymart, and adequate details were provided to the county compilers. Devich Farbotnik found the Red-necked Phalarope in southern *Bucks*. It was seen on private property along the Delaware River, in the same area where he found a Wilson's Phalarope on last year's count. Lightning strikes twice...

There were a few other notable shorebirds. At Presque Isle in *Erie*, two Ruddy Turnstones were seen at Gull Point. This is only the third NAMC observation of the species. Notable, if not countable, were four more Ruddy Turnstones in that region, reported from the Ohio side of Pymatuning Reservoir, just outside of *Crawford*. The count's fourth record of Willet came from *Franklin*, where one was observed at close range, and identified in flight as well as by call. Fifteen Black-bellied Plovers is above average for NAMC – birds were seen in *Armstrong* (2), *Bedford* (11), and *Erie* (2). The only new High Counts in this category were for Wilson's Snipe (49 in 13 counties), and American Woodcock (122 in 26). The highest counts for each came from John Fedak in *McKean*, where 28 and 29 were tallied, respectively.

Gulls and Terns

Due almost entirely to one huge flock of Laughing Gulls in southern *Bucks*, this bird was, by far, the most numerous on this year's count. An estimated 30,000 Laughing Gulls were in and around the Waste Management landfill in Tullytown, along the Delaware River. Sixty-seven more were found elsewhere in southern *Bucks*, and 13 were reported from *Philadelphia*, for a total of 30,080 Laughing Gulls! The species accounted for 12.45% of all birds reported on the NAMC. Of the other seven species of gull reported this year, the next most numerous *larid* was Ring-billed Gull, with 3,075 reported across 33 counties. There was a new HC for Bonaparte's Gull, with 100 in 11 counties,

compared to just three total birds last year. Lesser Black-backed Gulls were recorded for the third time on the NAMC, and for the first time outside of *Bucks*. Fifteen Lessers were seen along the Delaware River in *Northampton*, and one each was observed in *Bucks* and *Philadelphia*. White-winged gulls are not to be expected on May 10th, so a report of not just one, but *two* species is an excellent surprise! Both Iceland Gull and Glaucous Gull (one each) were found on the Delaware River at Tullytown in southern *Bucks*. Iceland Gull is a new addition to our NAMC list, and Glaucous Gull has now been found at this same site for two years in a row.

There was a good push of both Common and Forster's Terns through the state on count day, with new HCs recorded for each species. Common Terns (190) were reported from 12 counties. Several south-central counties reported small numbers, but higher counts came from the northwest, with birds in *Erie* (125), *Venango* (28), and *Forest* (3). Forster's Terns were also reported from 12 counties, with the highest count in *Dauphin* (117). This species was a bit more evenly distributed across the state. Ten Black Terns in six counties was above average. Caspian Terns seem to be very hit-or-miss on the NAMC: last year's HC of 97 birds was followed this year by a count of exactly three (1 each in *Erie*, *Indiana*, and *Lancaster*).

Doves through Nightjars

Eurasian Collared-doves were reported for the second year in a row, this time from *Franklin*. One of two known pairs was located there on count day. This pair has been present for at least two years, and nested in 2002. Last year's report came from nearby *York* County; it will be interesting to see how the species expands further into the state in coming years!

Sixty hours of nocturnal birding were logged across the state. While not much compared to 3,456 total hours, the effort yielded new HCs for three owl species: Great Horned (90), Barred (83), and Northern Saw-whet (11). Northern Saw-whet Owl was the surprise here, with reports from seven counts (3 each in *McKean* and *Union*, singles in *Bedford*, *Forest*, *Huntington*,

Luzerne and *Potter*). Unfortunately, a five-year low for Barn Owl was reported. Only ten were found, all in the south central portion of the state (*Bedford*, *Cumberland*, *Franklin* and *Juniata*). A few compilers reported that efforts to find known Barn Owls were unsuccessful. It should be noted that 'Barn Owling', as opposed to regular owling, is generally a daytime activity, so the lack of nocturnal hours is presumably not to blame for the paucity of owls in this case. Hopefully a more concerted effort will be made in future years to get out and count *all* of our owls, whether by night *or* by day!

Swifts through swallows

There were new HCs for several species in this category, including Belted Kingfisher, Warbling Vireo, Fish Crow, Common Raven, and four of our seven woodpecker species. Our count of Chimney Swifts was second only to last year's, with 3,891 birds observed in 56 counties. Of the woodpeckers, new HCs were attained for Yellow-bellied Sapsucker (137), Downy (1,164), Hairy (320), and Northern Flicker (1421). Red-headed Woodpeckers were less widely reported than last year, with 56 in 19 counties (compared to 83 in 22 for 2002). Olive-sided Flycatchers were found on six counts (two in *Westmoreland*). Four Yellow-bellied Flycatchers were found, all in *Juniata* near Mifflintown, and all by members of the Petersheim family, along with Marvin Troyer. The count for Least Flycatcher (259) was the highest since 1996, but this was the exception among the flycatchers. Counts for both Eastern Wood-Pewee (235) and Eastern Phoebe (868) were five-year lows, and the other *empids* were generally low as well. It was remarked that phoebes and pewees, at least, appeared in higher numbers in the days and weeks following the count.

One of the more interesting rarities discovered this year was a Loggerhead Shrike, found in *Fayette* by Sharon Kanareff. The NAMC trend for this species has not been particularly encouraging, with only the *Fayette* bird this year, one bird last year, and none at all on the two previous counts.

Table 7. Occurrence of Loggerhead Shrike on PA NAMC since 1993.

Year	Tot.	Counties
1993	2	Adams, Franklin
1994	11	Adams (8), Franklin (3)
1995	2	Adams
1996	4	Adams (2), Franklin (2)
1997	2	Adams
1998	5	Adams (3), Franklin (2)
2000	0	
2001	0	
2002	1	Greene
2003	1	Fayette

Reports of Loggerhead Shrike have been few and far between in Pennsylvania over the past several years, so it is hoped that the species is still regularly present somewhere in the south central or southwestern regions!

The High Count for Common Raven spiked sharply this year. Following a very consistent average of about 80 ravens since 1995, this year's total was 227! Ravens were observed in 31 counties. Our previous HC of 90 ravens was more than doubled thanks to a report from just one area: in *Potter*, Jack Mitterer has constructed scavenger feeders on his farm. His feeding stations, well stocked with slaughterhouse scraps, attract crows and raven in droves, as evidenced by his count of 111 Common Ravens (yes, 111 ravens – not a misprint...!) This must have been quite a sight to see!

Horned Larks were widespread this year, with 149 reported from 25 counties. Tree and Barn Swallows were our 7th and 8th most abundant birds, respectively. While not quite so numerous as last year, 1,166 Purple Martins were reported from a record 30 counties this time around.

Chickadees through waxwings

There was a new High Count among the chickadees this year, but it was for the 'chickadee species' category. 198 chickadees in 11 counties were *not identified* conclusively this year. Wariness among birders in the chickadee 'hybrid zone' is on the rise. It seems that, wisely, far more observers are less likely to rely on song and other equally suspect field marks when attempting to separate our two chickadee species!

Prompted by the severe dip in Carolina Wren numbers between NAMC '02 and NAMC '03, time was

spent sorting through past data for this species. As a year-round resident, our Carolina Wren (CAWR) population is highly susceptible to mass die-offs during harsh winters such as what we experienced in 2002-2003. Past data suggests that the population was hit hard in the winters of '93-'94 and again in '95-'96 (corroborated by CBC data), then grew steadily from year to year through 2002. Taking into consideration not only total birds counted, but also CAWR totals as a function of *all* birds (of *all* species) counted each year, the findings were as follows. A birds / field hour ratio would be helpful here, but it seems that NAMC hours weren't reported well until recent years.

Table 8. Occurrence of Carolina Wren on PA NAMC since 1993.

Year	Total	% of Total Count
1993	456	0.425%
1994	118	0.106%
1995	206	0.139%
1996	149	0.071%
1997	275	0.126%
1998	498	0.245%
2000	617	0.304%
2001	769	0.369%
2002	1456	0.563%
2003	800	0.331%

Specific areas of the state were looked at to try to see where Carolina Wrens may have suffered most. Hours per county were fairly consistent from 2001 to 2003 in the following examples (2001 / 2002 / 2003), and nearly all counties are well represented on the count:

In the southeast:

Lancaster 43 birds in 2001 / 76 in 2002 / 40 in 2003

Bucks 78 / 123 / 84

York 19 / 67 / 14

Moving north:

Schuylkill 11 / 18 / 19

Luzerne 19 / 16 / 30 (counts actually improved slightly here)

Central PA, south to north:

Franklin 56 / 91 / 55

Juniata 64 / 114 / 50

Centre 14 / 20 / 23 (another increase here)

Southwest:

Bedford 25 in '02 (111 hrs) / 16 in '03

(165 hrs)

Westmoreland 39 / 65 / 27

Greene 46 / 118 / 38 (huge rise and fall here)

Allegheny 47 / 100 / 25 (same here)

Indiana 36 / 64 / 22

Washington (fewer hours, but 12 CAWR in '02 and none this year)

Northwest:

Data from here doesn't tell much. *Erie* had five in '02 and none this year...

It seems that the Carolina Wren population may very well have taken a big hit this year across many portions of the state, particularly the southwest. The few increases in central PA may be statistical anomalies. Results of the 104th Christmas Bird Count this coming winter will no doubt cast further light upon the subject!

Unfortunately, following last year's record count, Eastern Bluebird numbers were at a five-year low in 2003. Only 1,384 were tallied, nearly a thousand less than our 2002 total. Hopefully these numbers aren't indicative of further casualties of the harsh winter. Again, results of the 104th CBC are anticipated!

There was an unprecedented effort among NAMC participants this year to get out and count nocturnal migrants, particularly thrushes! As a result, we had new HCs for three species (Gray-cheeked, Swainson's and Wood Thrush), and a fourth (Bicknell's) was recorded for the first time. In *Northumberland*, Deuane Hoffman began his morning with all six thrush species, including the count's first occurrence of Bicknell's Thrush! He ended his day in *Dauphin*, where he had two more Bicknell's. Deuane, like several other nocturnal listeners, also reported a few unknown Gray-cheeked/Bicknell's type calls, which are extremely difficult to distinguish under even the best of conditions.

In migration, thrushes often go unnoticed, skulking in the woods by day, and slipping away in the dark. The only real way to gauge the actual migration of this genus is to get out early (or late) and listen. To illustrate this point: the average count of Gray-cheeked Thrush for past NAMCs has been 6.5 birds. This year's High Count of 29 GCTH can be attributed to 24 birds detected nocturnally, including 17 reported by Andy McGann in *York*.

To further illustrate: of 51 Swainson's in *York*, Andy counted all but one nocturnally. All of *Northumberland*'s 76 Swainson's and 13 Hermit Thrushes were heard before dawn. *Lebanon*'s two Grey-cheeked and 43 Swainson's were reported nocturnally by Randy Miller. In *Erie*, the majority of thrushes (including 24 Swainson's) were heard passing over Ben Coulter's backyard. For anyone interested in learning the flight calls of thrushes and many other species, the CD-ROM "Flight Calls of Migratory Birds (Eastern North American Landbirds)", recorded by Bill Evans and Michael O'Brien, is widely recommended. For further information and to order, check out <http://www.oldbird.org/>.

One of the less desirable new HCs was of European Starling. A total of 14,190 starlings were seen in 57 counties.

Warblers

Warblers were very well represented on the count this year! Despite, or more likely, *due* to the weather system that passed through much of the state on the morning of the count, more warblers were recorded this year than any other. Over 31,000 warblers of 37 species were reported, and warblers accounted for 10.9% of all birds counted (a seven year high). The species total of 37 matched the NAMC record set in 1998 and 2001. Brewster's (6) and Lawrence's (5) Warblers were also recorded this year, but as hybrids, they are not included in the total species count. Highlights included Orange-crowned, Swainson's and Connecticut Warblers. Orange-crowned Warblers were reported by Gene Wilhelm in *Butler* (2), and by Mark Larson in *Union*. The count produced two different Swainson's Warblers, marking only the third time the species has been recorded on the count. Chris Knoll found a Swainson's Warbler at Sewickley Heights Borough Park in *Allegheny* on May 9, and the bird stuck around for the count. In *Mifflin*, Ivan Byler Sr. and Ivan Byler Jr. found a Swainson's singing near Belleville. Our only report of Connecticut Warbler this year came from *Tioga*, where Ann Vayansky spotted the bird in some underbrush on her farm in Mansfield. This irregular spring migrant has now been reported on six of eleven PA NAMC efforts, with a maximum of

three reported in 2002. New High Counts were set for eighteen warbler species, as well as for the Lawrence's hybrid! Notable HCs were set for Blue-winged (788), Yellow (4,332), Black-throated Blue (809), Black-throated Green (1,980), Blackburnian (724), American Redstart (2,008), Ovenbird (4,436) and Common Yellowthroat (4,636). Blue-winged Warblers outnumbered Golden-winged Warblers by a ratio of nearly 8:1, with 99 Golden-wings reported across the state. The count for Golden-winged was second only to 1994's total of 124. It's interesting (though not necessarily a reliable indication of the overall trend), that in 1994, the ratio of Blue-winged to Golden-winged was a mere 3:1. It should be noted that this ratio has fluctuated wildly over the past decade, and that this year's ratio is very close to the eleven year NAMC average.

Tanagers through sparrows

This category contains a species of particular interest, namely, Summer Tanager. Summer Tanagers occur more commonly in states to our south, but occur irregularly each spring in certain southern portions of Pennsylvania as well. They have been recorded as rare nesters in several southwestern counties. Most NAMC records of the species have come from *Greene* (4 times), but they have also been recorded in *Adams, Allegheny, Chester, Indiana*, and, oddly enough, *Venango*. Following the no-show for the species in 2002, a single bird was found this year by Jim Dearing in *Indiana*. As is often the case with this species, the bird was not re-found the following day. This was *Indiana's* second NAMC record of Summer Tanager, the first having been three birds recorded in 1996.

Our other tanager, the Scarlet Tanager, is much more common! A significant proportion of the species' overall population is thought to breed right here within our state's forests, so it's worth taking a look at recent PA NAMC trends for this species. A total of 1,996 Scarlet Tanagers was reported this year, just 173 shy of last year's record count. The percentage of Scarlet Tanagers as a function of all birds counted on the NAMC has hovered consistently at about 0.82% over the past five years. There was a noticeable

dip from 1996 to 1999. The percentage was slightly higher in the first few years of the count, but it must be noted that coverage wasn't as widespread then:

Table 8. Occurrence of Scarlet Tanager on PA NAMC since 1993.

Year	Total	% Total Ct
1992	78	0.226%
1993	930	0.868%
1994	1013	0.909%
1995	1383	0.933%
1996	1582	0.759%
1997	621	0.284%
1998	1022	0.504%
2000	1655	0.815%
2001	1717	0.824%
2002	2169	0.839%
2003	1996	0.826%

There were some nice counts of sparrows this year, including four new High Counts. New HCs were set for Eastern Towhee (3,648), Vesper Sparrow (104), Swamp Sparrow (354), and White-throated Sparrow (1,859), which was remarked to have been a bit late to depart this spring. The same can be said for American Tree Sparrow; 34 were counted, tying the HC from 1997. This species has been recorded on just over half (6) of our counts. The best bird in this family was a Clay-colored Sparrow seen at Presque Isle in *Erie*. Compiler Ben Coulter reported: "...one (Clay-colored) with a Chipping Sparrow in a grassy island at the Perry Monument lot. There had been scattered sightings of this species for several days prior to the count". Ben added that the species is annual on Presque Isle in early to mid May, and was seen by multiple observers. Annual or not, a very nice bird! Clay-colored Sparrow has, in fact, now been recorded annually on the NAMC since 2000, and five times overall.

Cardinals through finches

In this category, there were five new High Counts. Rose-breasted Grosbeak, Bobolink and Red-winged Blackbird were all present in record numbers. The other two new records are a bit more dubious: Brown-headed Cowbirds and House Sparrows are alive and well, and on the rise. House Sparrows (5,823 of them) made up 2.4% of all birds counted this year.

The winter of 2002-2003 produced very few 'northern' finches, so it's no surprise that the more unusual species were not found on the NAMC either. The Purple Finch count (238) was the lowest since 1993, when only 29 counties reported. Surprising was a report of ten Evening Grosbeak from *Bradford*. Evening Grosbeak were largely unreported statewide over the previous winter, so the appearance of a small flock at the Duvall's on count week seems significant. Two to four birds had been noted in previous days, but the number spiked to ten on count day! Pine Siskin was missed for the first time in the count's twelve-year history.

In summary...

I would like to thank each and every person that helped out with Pennsylvania's North American Migration Count this year! The count has become a real institution for many of the state's birders, but greater participation is certainly possible, and hopefully will be attained in the coming years. The data that we all collect each year is an invaluable addition to Pennsylvania's vast ornithological record! The thirteenth Migration Count will take place on Saturday, May 8, 2004, rain or shine! Mark your calendars now!

Appendix. List of coordinators.

Due to the large number of participants in Pennsylvania's NAMC, all counters cannot be listed as in past years. County coordinators and their contact information are listed below. For certain counties, multiple names with no contact info may be listed. This usually indicates that the county had participants, but no actual coordinator.

PA State NAMC Coordinator -
